

Alterations made during Stage 4

Team Viewer Emergency meeting.

04 March 2017 – date started using Team Viewer.

The implementation for the Personal Details GUI was running behind schedule so the team had to introduce Team Viewer software. The software has a 'Meeting' application that connects PCs so they can talk to each other and see another member's screen live. Sahib setup a meeting and had his screen windowed for other members to see. We can see live what Sahib was doing and we have the ability to control Sahib's screen so we can make changes to the code remotely.

Team Viewer starting from now will be used for remote meetings, reviewing and feedback.
