Iteration 3- Pet Project Plan

Marc:

In iteration three my main focus was to implement the Journey Planner feature. The plan was to have a to and from search box which the user can input into. This would then call the Transport API which will give the user the postcode or bus stops based on their search. Once they had selected their from and to location and selected the time they planned to leave, it would calculate their journey. This would be another API call that would tell the user how to get to their destination and how long this will take, giving the user multiple routes they could take to reach their destination. This was an important feature as it was also needed to implement the calendar feature which is mentioned below.

Sahib:

In this iteration my main focus will be developing a calendar feature. This will be done by retrieving the events from the phone calendar and creating the interface to view the events from the calendar in which the user would be able to select an event and plan their journey with the journey planner that Marc is implementing in this iteration.
